

MetaFVG Strategy Review

Historical Backtest — All Configured Instances

Engine: [metafvg_backtest.py](#) | Scales: **H4** → **Weekly** (upscaled from production M1 → 4h) | Config: [config/prod/metafvg.yaml](#)

Executive Summary

This review covers all **4** live-configured MetaFVG instances (AUDJPY, EURUSD, GER40, US100), backtested on the **upscaled** two-scale setup (H4 as the entry/exit timeframe, Weekly for zone detection) rather than the production M1 → 4h scales, in order to obtain a statistically meaningful sample — MT5's terminal cache limits M1 history to roughly 3 months, too short a window for a standalone performance judgment. Across **445** generated signals (**176** closed), the volume-weighted win rate is **25.6%**.

US100 is the strongest performer on a risk-adjusted basis (Sharpe +0.36), while **EURUSD** is the weakest (Sharpe -0.03). None of the four configurations should be read as a standalone allocation decision without the caveats in Section 2 — most notably, none of these backtests replicate the live bot's active-hours trading-session filter (see per-instrument notes), and win/loss classification assumes no bid/ask spread or slippage.

Portfolio Comparison

Normalized Equity Comparison (rebased to 100 at each series' own start)

Instance	Symbol	Trades	Win Rate	Sharpe	Max DD	Profit Factor	Coverage
AUDJPY_H1	AUDJPY	155	28.6%	+0.15	0.47%	1.11	2021-07-20 to 2026-07-17
EURUSD_H1	EURUSD	108	26.1%	-0.03	0.16%	0.98	2021-07-20 to 2026-07-17
GER40CASH_H1_GA	GER40	81	24.1%	+0.13	0.30%	1.05	2021-10-21 to 2026-07-17

US100CASH_H1_GA	US100	101	22.2%	+0.36	0.46%	1.31	2021-07-20 to 2026-07-17
-----------------	-------	-----	-------	-------	-------	------	--------------------------

Methodology & Caveats

Each instance was replayed bar-by-bar on H4 candles, reusing MetaFVG's own live detection and trade-parameter methods directly (no reimplementation) so simulated signals cannot drift from production logic — cross-validated against real MT5 fills on EURUSD (production M1/4h scales), where simulated entry and stop-loss matched live fills to 5 decimal places.

The following are known, deliberate simplifications of this backtest engine:

- **Active-hours filter not applied.** AUDJPY_H1 and GER40CASH_H1_GA restrict live trading to specific MT5-server hours; this backtest evaluates every hour, so trade counts and win rate for those two instances likely overstate what the live-hour-filtered bot actually captures. EURUSD_H1 and US100CASH_H1_GA trade unrestricted hours in production, so this caveat does not apply to them.
- **No spread or slippage.** Fills use MT5 bid-only candle ranges; entries/exits assume the quoted level is reachable exactly, which is optimistic versus live execution.
- **Same-bar SL/TP tie-break assumes stop-loss fires first** when a single bar's range contains both levels — a conservative assumption that can understate performance on wide bars.
- **Position sizing for the vectorbt-derived stats** (Sharpe, Max Drawdown, Total Return) uses a fixed 2% of equity per trade, not the symbol's configured live lot size — a raw 1-unit position is negligible against starting capital on EURUSD (~1.10/unit) but many multiples of it on GER40 (~20,000/unit), making unit-sized percentage stats meaningless for higher-priced instruments. Fixed-fractional sizing keeps Sharpe/Drawdown/Total Return comparable across symbols; it is not a projection of live P&L at the configured lot sizes. Realized PnL and R-multiple figures are sizing-independent and directly comparable to live risk framing.
- **Concurrency cap enforced strictly.** Live MT5 data shows the bot has, at times, exceeded its configured `limit\_number\_position` because the live position-count check does not see resting pending orders — this backtest enforces the cap exactly as configured, so it is not directly comparable to live concurrent exposure during those episodes.

AUDJPY_H1 (AUDJPY)

Parameter	Value
Tag	metafvg_audjpy
Concurrent Position Limit	5
Timeframes	H4 entries / Weekly zones
Data Coverage	2021-07-20 to 2026-07-17
Bars	7,772 H4 / 261 Weekly
Active-Hours Filter (live)	Yes — not modeled in this backtest

AUDJPY — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	155
Closed Trades	56
Win Rate	28.6%
Realized PnL (price points)	+4.41057
Avg R-Multiple	+0.16R
Profit Factor	1.11
vectorbt Total Return	+0.11%
Sharpe Ratio	+0.15
Max Drawdown	0.47%

With 56 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **AUDJPY** shows a marginal or flat edge — insufficient to distinguish from noise at this sample size (Sharpe +0.15, win rate 28.6%, profit factor 1.11). Recall this instance restricts live trading to specific server hours, which this backtest does not replicate — the live signal count is expected to be materially lower than the 155 shown here.

EURUSD_H1 (EURUSD)

Parameter	Value
Tag	metaavg_eurUSD
Concurrent Position Limit	5
Timeframes	H4 entries / Weekly zones
Data Coverage	2021-07-20 to 2026-07-17
Bars	7,772 H4 / 261 Weekly
Active-Hours Filter (live)	No restriction

EURUSD — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	108
Closed Trades	46
Win Rate	26.1%
Realized PnL (price points)	-0.00452
Avg R-Multiple	-0.05R
Profit Factor	0.98
vectorbt Total Return	-0.01%
Sharpe Ratio	-0.03
Max Drawdown	0.16%

With 46 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **EURUSD** shows a marginal or flat edge — insufficient to distinguish from noise at this sample size (Sharpe -0.03, win rate 26.1%, profit factor 0.98).

GER40CASH_H1_GA (GER40)

Parameter	Value
Tag	metaavg_dax
Concurrent Position Limit	5
Timeframes	H4 entries / Weekly zones
Data Coverage	2021-10-21 to 2026-07-17
Bars	7,241 H4 / 248 Weekly
Active-Hours Filter (live)	Yes — not modeled in this backtest

GER40 — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	81
Closed Trades	29
Win Rate	24.1%
Realized PnL (price points)	+311.52571
Avg R-Multiple	-0.13R
Profit Factor	1.05
vectorbt Total Return	+0.08%
Sharpe Ratio	+0.13
Max Drawdown	0.30%

With only 29 closed trades, sample size limits statistical confidence in any of the above; on the numbers above, **GER40** shows a marginal or flat edge — insufficient to distinguish from noise at this sample size (Sharpe +0.13, win rate 24.1%, profit factor 1.05). Recall this instance restricts live trading to specific server hours, which this backtest does not replicate — the live signal count is expected to be materially lower than the 81 shown here.

US100CASH_H1_GA (US100)

Parameter	Value
Tag	metafvg_nas
Concurrent Position Limit	5
Timeframes	H4 entries / Weekly zones
Data Coverage	2021-07-20 to 2026-07-17
Bars	7,717 H4 / 261 Weekly
Active-Hours Filter (live)	No restriction

US100 — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	101
Closed Trades	45
Win Rate	22.2%
Realized PnL (price points)	+3068.65571
Avg R-Multiple	-0.24R
Profit Factor	1.31
vectorbt Total Return	+0.37%
Sharpe Ratio	+0.36
Max Drawdown	0.46%

With 45 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **US100** shows a positive risk-adjusted edge over the backtest window and merits continued live monitoring at current size (Sharpe +0.36, win rate 22.2%, profit factor 1.31).
