

MetaFVG Strategy Review

Historical Backtest — All Configured Instances

Engine: [metafvg_backtest.py](#) | Scales: M15 → 4h | Config: [config/prod/metafvg.yaml](#)

Executive Summary

This review covers all 4 live-configured MetaFVG instances (AUDJPY, EURUSD, GER40, US100), backtested with M15 as the entry/exit timeframe and 4h for zone detection — between production's M1 → 4h scales and the fully-upscaled H4 → Weekly setup. MT5's terminal cache limits how far back finer timeframes are actually available (M1 to roughly 3 months on this server); each instance's actual data coverage is shown in its own section below rather than assumed. Across 5116 generated signals (4125 closed), the volume-weighted win rate is 22.9%.

AUDJPY is the strongest performer on a risk-adjusted basis (Sharpe +0.85), while US100 is the weakest (Sharpe -0.62). None of the four configurations should be read as a standalone allocation decision without the caveats in Section 2 — most notably, none of these backtests replicate the live bot's active-hours trading-session filter (see per-instrument notes), and win/loss classification assumes no bid/ask spread or slippage.

Portfolio Comparison

Normalized Equity Comparison (rebased to 100 at each series' own start)

Instance	Symbol	Trades	Win Rate	Sharpe	Max DD	Profit Factor	Coverage
AUDJPY_H1	AUDJPY	1171	25.7%	+0.85	0.20%	1.20	2022-07-12 to 2026-07-20
EURUSD_H1	EURUSD	1355	21.9%	-0.09	0.33%	0.98	2022-07-12 to 2026-07-20
GER40CASH_H1_GA	GER40	1356	22.4%	+0.14	0.38%	1.03	2022-03-30 to 2026-07-20

US100CASH_H1_GA	US100	1234	21.9%	-0.62	1.09%	0.88	2022-04-22 to 2026-07-20
-----------------	-------	------	-------	-------	-------	------	--------------------------

Methodology & Caveats

Each instance was replayed bar-by-bar on M15 candles, reusing MetaFVG's own live detection and trade-parameter methods directly (no reimplementation) so simulated signals cannot drift from production logic — cross-validated against real MT5 fills on EURUSD (production M1/4h scales), where simulated entry and stop-loss matched live fills to 5 decimal places.

The following are known, deliberate simplifications of this backtest engine:

- **Active-hours filter not applied.** AUDJPY_H1 and GER40CASH_H1_GA restrict live trading to specific MT5-server hours; this backtest evaluates every hour, so trade counts and win rate for those two instances likely overstate what the live-hour-filtered bot actually captures. EURUSD_H1 and US100CASH_H1_GA trade unrestricted hours in production, so this caveat does not apply to them.
- **No spread or slippage.** Fills use MT5 bid-only candle ranges; entries/exits assume the quoted level is reachable exactly, which is optimistic versus live execution.
- **Same-bar SL/TP tie-break assumes stop-loss fires first** when a single bar's range contains both levels — a conservative assumption that can understate performance on wide bars.
- **Position sizing for the vectorbt-derived stats** (Sharpe, Max Drawdown, Total Return) uses a fixed 2% of equity per trade, not the symbol's configured live lot size — a raw 1-unit position is negligible against starting capital on EURUSD (~1.10/unit) but many multiples of it on GER40 (~20,000/unit), making unit-sized percentage stats meaningless for higher-priced instruments. Fixed-fractional sizing keeps Sharpe/Drawdown/Total Return comparable across symbols; it is not a projection of live P&L at the configured lot sizes. Realized PnL and R-multiple figures are sizing-independent and directly comparable to live risk framing.
- **Concurrency cap enforced strictly.** Live MT5 data shows the bot has, at times, exceeded its configured `limit\_number\_position` because the live position-count check does not see resting pending orders — this backtest enforces the cap exactly as configured, so it is not directly comparable to live concurrent exposure during those episodes.

AUDJPY_H1 (AUDJPY)

Parameter	Value
Tag	metafvg_audjpy
Concurrent Position Limit	5
Timeframes	M15 entries / 4h zones
Data Coverage	2022-07-12 to 2026-07-20
Bars	99,995 M15 / 8,819 4h
Active-Hours Filter (live)	Yes — not modeled in this backtest

AUDJPY — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	1171
Closed Trades	939
Win Rate	25.7%
Realized PnL (price points)	+24,62243
Avg R-Multiple	+0.09R
Profit Factor	1.20
vectorbt Total Return	+0.48%
Sharpe Ratio	+0.85
Max Drawdown	0.20%

With 939 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **AUDJPY** shows a positive risk-adjusted edge over the backtest window and merits continued live monitoring at current size (Sharpe +0.85, win rate 25.7%, profit factor 1.20). Recall this instance restricts live trading to specific server hours, which this backtest does not replicate — the live signal count is expected to be materially lower than the 1171 shown here.

EURUSD_H1 (EURUSD)

Parameter	Value
Tag	metaavg_eurusd
Concurrent Position Limit	5
Timeframes	M15 entries / 4h zones
Data Coverage	2022-07-12 to 2026-07-20
Bars	99,984 M15 / 8,819 4h
Active-Hours Filter (live)	No restriction

EURUSD — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	1355
Closed Trades	1107
Win Rate	21.9%
Realized PnL (price points)	-0.01764
Avg R-Multiple	+0.05R
Profit Factor	0.98
vectorbt Total Return	-0.04%
Sharpe Ratio	-0.09
Max Drawdown	0.33%

With 1107 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **EURUSD** shows a marginal or flat edge — insufficient to distinguish from noise at this sample size (Sharpe -0.09, win rate 21.9%, profit factor 0.98).

GER40CASH_H1_GA (GER40)

Parameter	Value
Tag	metafvg_dax
Concurrent Position Limit	5
Timeframes	M15 entries / 4h zones
Data Coverage	2022-03-30 to 2026-07-20
Bars	99,995 M15 / 9,440 4h
Active-Hours Filter (live)	Yes — not modeled in this backtest

GER40 — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	1356
Closed Trades	1065
Win Rate	22.4%
Realized PnL (price points)	+1277.09571
Avg R-Multiple	-0.01R
Profit Factor	1.03
vectorbt Total Return	+0.10%
Sharpe Ratio	+0.14
Max Drawdown	0.38%

With 1065 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **GER40** shows a marginal or flat edge — insufficient to distinguish from noise at this sample size (Sharpe +0.14, win rate 22.4%, profit factor 1.03). Recall this instance restricts live trading to specific server hours, which this backtest does not replicate — the live signal count is expected to be materially lower than the 1356 shown here.

US100CASH_H1_GA (US100)

Parameter	Value
Tag	metafvg_nas
Concurrent Position Limit	5
Timeframes	M15 entries / 4h zones
Data Coverage	2022-04-22 to 2026-07-20
Bars	99,984 M15 / 9,303 4h
Active-Hours Filter (live)	No restriction

US100 — Equity Curve (vectorbt, 2% fixed-fractional)

Metric	Value
Total Signals Generated	1234
Closed Trades	1014
Win Rate	21.9%
Realized PnL (price points)	-5226.89429
Avg R-Multiple	-0.13R
Profit Factor	0.88
vectorbt Total Return	-0.64%
Sharpe Ratio	-0.62
Max Drawdown	1.09%

With 1014 closed trades, the sample is large enough for a preliminary read, though still short of what would be required for a capital allocation decision; on the numbers above, **US100** shows a negative risk-adjusted return over the backtest window and should be reviewed before further live sizing (Sharpe -0.62, win rate 21.9%, profit factor 0.88).
